

Namespace: **Type**

Headline

Namespace for subject and object types of semantic properties on 101wiki

Description

Semantic properties are described in terms [Property:hasDomain](#) and [Property:hasRange](#), i.e., the domain and range of properties. We use the term 'type' rather than 'namespace' here because the object of a semantic property could be a primitive value (see [Type:String](#)) or a URI (see [Type:URI](#)). Obviously, the subject of any property on 101wiki must be a page on 101wiki. There is (there should be) a type for each namespace. There is the special [Type:Any](#) to proxy for the union of all namespaces.
